History of C++

- During 1970 Dennis Ritchie created C Programming language.
- C++ was developed by Bjarne Stroustrup at AT & T Bell Laboratories in 1979 and new language was based upon the C language and called C with Classes. Later in 1983 the language was called C++.
- C++ is an OOP i.e. Object Oriented Programming, which allows programmers to develop large and complex applications.

Table of Contents

Numerical Computation

- C++ is power full tools for Numerical Computation.
- Arithmetic Function: “math.h” header file supports all the mathematical related functions in C/C++ language.
- User define function. More likely mathematical functions.
- For example $f(x)=x^2 + 2x + 5$. *Derivative?*

https://github.com/suptaphilip/C-Plus-Plus-Everything-You-Should-Know/blob/main/User_Define_Function.cpp

Number Generation

- Number Generation is important for simulation.
- Create vector $v = \text{linspace}(0, 1, 5)$ $v = [0 \ 0.2 \ 0.4 \ 0.6 \ 0.8 \ 1.0]$
- Example sigmoid and tanh function.
- Random Number Generation: `stdlib.h` and `time.h` helps to generate random numbers.

C-Plus-Plus-Everything-You-Should-Know/blob/main/
linspace.cpp](https://github.com/suptaphilip/C-Plus-Plus-Everything-You-Should-Know/blob/main/linspace.cpp)

[https://github.com/suptaphilip/
C-Plus-Plus-Everything-You-Should-Know/blob/main/
Random_number.cpp](https://github.com/suptaphilip/C-Plus-Plus-Everything-You-Should-Know/blob/main/Random_number.cpp)

Computational Biology

- String and DNA sequence.
- ACGT is an acronym for the four types of bases found in a DNA molecule: adenine (A), cytosine (C), guanine (G), and thymine (T).

<https://github.com/suptaphilip/C-Plus-Plus-Everything-You-Should-Know/blob/main/DNA.cpp>

Numerical Analysis

- Root findings and Numerical Integration.
- Let $f(x)$ be continuous on $[a,b]$. We partition the interval $[a,b]$ into n equal sub intervals, each of width
$$\Delta x = \frac{b-a}{n}, a = x_0 < x_1 < x_2 < \dots < x_n = b.$$

The Trapezoidal Rule for approximating $\int_a^b f(x) dx$
$$\approx \frac{\Delta x}{2} [f(x_0) + 2f(x_1) + 2f(x_2) + \dots + 2f(x_{n-1}) + f(x_n)]$$
 where $x_i = a + i\Delta x$.

https://github.com/suptaphilip/C-Plus-Plus-Everything-You-Should-Know/blob/main/Numerical_Integration.cpp

Numerical Integration using Trapezoidal Rule

Numerical Analysis

- Root findings using Newton Raphson method.
- Newton's method (or Newton Raphson method) is an iterative procedure used to find the roots of a function.
- Start with an initial approximation $x_0 = c$.

$$x_1 = x_0 - \frac{f(x_0)}{f'(x_0)}.$$

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$$

https://github.com/suptaphilip/C-Plus-Plus-Everything-You-Should-Know/blob/main/Newtons_Rapson.cpp

Root findings using Newton Raphson method

Research area using C++ Language

- Mathematical modeling
- ML/Computer vision/ Robotics/ Image processing
- Network Theory/ Graph Theory
- Artificial Neural networks/ Deep Learning

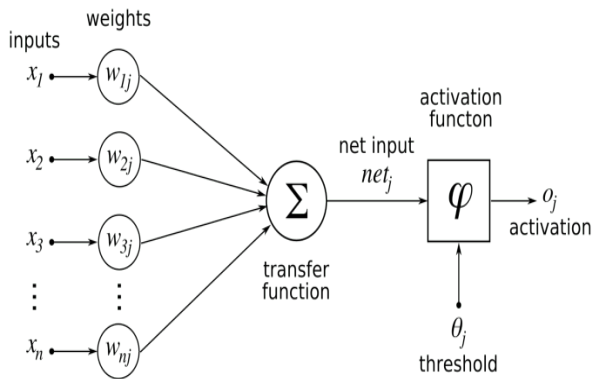

Table of Contents

- 1 History of C/C++
- 2 C++ is Powerful Language
- 3 Why is C++ so Powerful?

Class and Object

- Representing complex data, for example image data as matrix.
- User define data type as List of Object.
- Example: Weather data.

[https://github.com/suptaphilip/
C-Plus-Plus-Everything-You-Should-Know/blob/main/
RainFull.cpp](https://github.com/suptaphilip/C-Plus-Plus-Everything-You-Should-Know/blob/main/RainFull.cpp)

Dynamic Memory Allocation/Pointer

- Very Useful in Linear Algebra. Used for Matrix operation; Matrix Transpose, Matrix Multiplication.

[https://github.com/suptaphilip/
C-Plus-Plus-Everything-You-Should-Know/blob/main/
Dynamic_2D_Array.cpp](https://github.com/suptaphilip/C-Plus-Plus-Everything-You-Should-Know/blob/main/Dynamic_2D_Array.cpp)

Standard Template Library (STL).

- Standard Template Library (STL) is a set of C++ template classes to provide common programming data structures and functions.
- Class Templates Like function templates, class templates are useful when a class defines something that is independent of the data type.

The steps you can follow to learn C++

- Data Types and Variables
- Operator and Expression
- Decision(if else/switch)
- Iteration(Loops)
- Array/List
- Function
- String
- Pointer and Dynamic memory allocation
- Class and Object(OOP)
- Standard Template Library (STL)
- Templates Class and function templates,

Data Types and Variables

- Integer: (signed) int, 32 bits, Range: $-2^{31} - 1$ to $2^{31} - 1$
- Integer: unsigned int, 32 bits, Range: 0 to $2^{32} - 1$
- Integer: (signed) long long int, 64 bits, Range: $-2^{63} - 1$ to $2^{63} - 1$
- Integer: unsigned long long int, 64 bits, Range: 0 to $2^{64} - 1$
- float: 32 bits, single precision, $\pm 1.18 \times 10^{-38}$ to $\pm 3.4 \times 10^{38}$
- double: 64 bits, double precision, $\pm 2.23 \times 10^{-308}$ to $\pm 1.80 \times 10^{308}$
- Boolean (T/F)
- char: 8 bits
- String

Operator and Expression

- Arithmetic Operator (+, -, *, /, %, ++, --)
- Conditional Operator
- Logical Operator
- Ternary Operator

Reference Books

Reference Books
